

10kV Small Busbar Configuration

Article Overview

A 10kV small busbar system typically consists of busbars, supports, adapters, protective devices, connectors, and safety accessories.

Primary Components

Busbars: These are the main current-carrying elements, usually made of copper or aluminum, sized according to the rated current and short-circuit requirements. They distribute electricity efficiently across multiple circuits in a parallel configuration .

Busbar Supports: These maintain correct phase spacing, provide electrical insulation, and withstand mechanical forces during short-circuit events. Modular supports allow different busbar sizes to be used within the same system .

Adapters: Busbar adapters provide a direct connection interface between the busbar and protection devices. Adjustable adapters are particularly useful for compatibility with multiple MCCB frame sizes, simplifying panel design .

Protective Devices: Commonly mounted directly onto busbar systems, these include MCCBs (Molded Case Circuit Breakers), fuse switch disconnectors, and isolator switches. They reduce wiring length, lower contact resistance, and improve electrical and thermal performance .

Connectors and Clamps: These ensure reliable joints, mechanical stability, and secure connections between busbar segments or to external devices .

Safety Accessories: Phase barriers, space covers, and other protective elements enhance operator safety, prevent accidental contact, and improve panel organization .

Additional Units in Busbar Trunking Systems

For small 10kV busbar trunking systems, additional units may include:...
