

3CWDM Wavelength Division Multiplexer

Article Overview

A 3CWDM Wavelength Division Multiplexer combines three separate optical signals onto a single fiber using coarse wavelength spacing, enabling efficient transmission of multiple data streams over one fiber.

Overview of CWDM

Coarse Wavelength Division Multiplexing (CWDM) is a fiber-optic technology that increases network bandwidth by transmitting multiple data streams on different light wavelengths through a single optical fiber. CWDM is termed "coarse" because the wavelength channels are spaced widely, typically 20 nm apart, which allows the use of less expensive, non-temperature-controlled lasers. This contrasts with Dense Wavelength Division Multiplexing (DWDM), which uses much narrower spacing for higher channel density.

How a 3CWDM Multiplexer Works

A 3CWDM multiplexer specifically combines three distinct wavelengths onto a single fiber. The process involves:

- **Multiplexing:** At the transmitter, three separate optical signals, each at a unique wavelength, are combined using a CWDM multiplexer into one fiber.
- **Transmission:** The combined signals travel over a single fiber, reducing the need for multiple fibers and lowering infrastructure costs.
- **Demultiplexing:** At the receiving end, a CWDM demultiplexer separates the three wavelengths back into individual channels for processing. Each wavelength can car...
