

ADSS Fiber Optic Cable Operation Method

Article Overview

ADSS fiber optic cables are installed using controlled tension methods, primarily the stationary reel method, with careful attention to sag, span tension, and safety precautions.

Installation Methods

The stationary reel method is the standard approach for ADSS cable installation. In this method, the cable reel is positioned at one end of the span, and a take-up reel is placed at the other end. A pull line is threaded through travelers along the route, and the ADSS cable is attached to the pull line using a woven wire pulling eye. The cable is then pulled under controlled tension to prevent exceeding the minimum bending radius and to avoid damage to the fiber core. The moving reel method is generally not recommended because it can create uneven tension and stress on the cable.

Tension and Sag Management

Two types of tension are critical during ADSS operation:

- **Maximum pulling tension:** The force applied while pulling the cable should not exceed the cable's specified limit, typically up to 600 lbF (2700 N) for aerial installations. Exceeding this can damage the cable.
- **Span tension:** After installation, the cable is placed in pole hardware under calculated tension to achieve a target sag, usually around 1% of the span length. Span tension accounts for environmental loads such as wind and ice. Sag and tension calculations are essential to ensure the cable remains within safe mechanic...
