

Add fiber optic cable to the wall

Article Overview

Installing fiber optic cable in a wall requires careful planning, protective conduit, proper handling, and precise termination to maintain signal integrity.

Planning the Installation

Start by mapping the route from the service entry point to the desired termination location, such as a media closet or network rack. Identify all wall entry and exit points, avoiding areas with heat sources, high foot traffic, or sharp edges that could damage the cable jacket. Measure the total length and add extra slack (at least 3 meters at each end) for future maintenance or rework .

Selecting the Cable and Conduit

Choose the appropriate fiber type: single-mode for long distances or future-proofing, and multimode for shorter runs. For indoor wall installations, use riser-rated or plenum-rated cables depending on whether the cable passes through air-handling spaces . Protect the cable with flexible low-voltage conduit or innerduct to prevent crushing, accidental cuts, or damage during renovations . A minimum conduit diameter of 3/4 inch is recommended to allow easy pulling and future upgrades.

Tools and Safety

Essential tools include fiberglass fish tape, cable-pulling lubricant compatible with the jacket, Kevlar shears, and safety glasses to protect against glass shards . Avoid using standard zip ties; instead, secure the cable with hook-and-loop fasteners to prevent...
