

Aerial Distance of Drop Fiber Optic Cable

Overview

Aerial drop cables typically span short distances (≤ 150 feet), contain up to 12 fibers, and are designed to support tensile loads up to 300 lb. These cables are comparatively smaller, lighter, and more economical versus larger aerial self-supporting cables used in distribution. Optical drop cables used in fiber-to-the-X (FTTX) applications share many basic design fundamentals with traditional outside plant cables. However, the specific applications environment in which they are deployed may require that certain other design attributes be given special consideration when. is properly limited [1,2]. However, these limits may be exceeded if a cab is used inappropriately. A good analogy for his is an automotive tire. This comprehensive guide delves into fiber optic drop cables, exploring. The Dielectric Standard Single Tube Drop (SST-Drop) cable is an optical cable containing a single, 3 mm buffer tube with 1 to 12 fibers. Aerial installation is generally much less costly than underground construction also.
