

Analysis of the disadvantages of aggregation switches

Overview

Disadvantages: No automatic link detection or recovery. Any mismatch in configuration can cause a link failure. Difficult to scale or modify dynamically. Small office or LAN environments where topology changes are rare. Read more: [Dynamic vs Static Link Aggregation – Key Differences](#). An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers. This arrangement increases throughput beyond what a single relationship could sustain, offers redundancy in case one of the links. Advantages: Simple configuration, ideal for small and stable networks. No control traffic overhead (no LACPDU). It is essential for larger networks requiring efficient data flow.
