

Base below the distribution box

Article Overview

The base of a distribution box is a welded, integrated structure that provides stability, support, and protection for the electrical components inside.

Structure and Function

The base of a distribution box is fixed and welded to the bottom of the enclosure, forming a solid foundation for the entire unit . It typically consists of a bottom plate and side plates, which are integrated into a single structure through one-time molding and welding. This design ensures mechanical strength, consistency in production, and durability, making it suitable for mass manufacturing and long-term use .

Material and Construction

High-quality distribution box bases are made from sturdy materials such as powder-coated or epoxy-coated stainless steel or engineering thermoplastics like polycarbonate (PC) and acrylonitrile styrene acrylate (ASA) . The welding and integrated molding process eliminates joints or weak points, enhancing the structural integrity and sealing performance of the box . This prevents deformation under load and protects internal components from environmental factors like dust, moisture, and mechanical impact.

Practical Benefits

- **Stability:** The base supports the weight of the distribution box and its internal com...
