

Bending of the distribution box casing

Article Overview

Distribution box casings are bent using specialized sheet metal forming techniques to ensure precision, structural integrity, and compatibility with electrical components.

Sheet Metal Bending Techniques

Distribution box casings are typically made from sheet metal up to 2 mm thick and are bent using automated bending and forming lines. These processes allow for precise shaping of the casing and doors from a single piece of metal, ensuring 100% closed corners and consistent dimensions across production batches (WEMO) . Automated lines can integrate punching, bending, and the addition of fixing components, which improves efficiency and reduces production costs .

Machinery for Bending

Modern production often uses panel bending centers, such as the BDC1500, which are designed for high precision and stability in industrial environments. These machines can handle complex bends and maintain consistent angles, which is critical for electrical enclosures where alignment and fit are essential . The bending process can accommodate various cabinet depths and shapes, allowing for flexibility in design.

Structural Considerations

When bending casings, it is important to account for material stress and potential deformation. Proper bending techniques prevent buckling or cracking, especially at...
