

Bolivia Electronystagmography System Product Introduction

Overview

Electronystagmography (ENG) is a diagnostic test to record involuntary movements of the eye caused by a condition known as. It can also be used to diagnose the cause of, or dysfunction by testing the. Electronystagmography is used to assess voluntary and involuntary. It evaluates the and the (CN III). The ENG can be used to determine the origin of various eye and ear disorders.

Article Overview

Electronystagmography (ENG) systems in Bolivia are advanced diagnostic tools used to evaluate balance disorders and involuntary eye movements, integrating real-time recording and analysis for clinical applications.

Overview of ENG Systems

Electronystagmography (ENG) is a diagnostic test that records involuntary eye movements (nystagmus) to assess vestibular function and identify causes of vertigo, dizziness, or balance dysfunctions. Electrodes are placed around the eyes to measure the corneo-retinal potential, capturing both voluntary and involuntary eye movements. ENG evaluates the cochlear nerve and oculomotor nerve (CN III) and can help distinguish between peripheral and central vestibular disorders (Hopkins Medicine, Wikipedia) .
