

Cable branch inside cable tray

Article Overview

Cable branching inside a cable tray can be achieved safely by using proper tray types, maintaining bend radii, and ensuring adequate support and separation for exiting cables.

Choosing the Right Cable Tray

For branching applications, mesh cable trays are particularly effective because their open grid design allows cables to be fed in and out in multiple directions, making bends and branches easier to create without damaging the cables (OBO CMS), . Solid or ventilated trays can also be used, but they may require additional fittings or cutouts to allow branching.

Maintaining Bend Radius and Cable Integrity

When cables exit the main tray to branch off to equipment or other trays, it is crucial to maintain the minimum bend radius specified by the cable manufacturer to prevent damage and signal degradation (ABB Cable Tray Technical Guide), . Typically, a rung spacing of 150–230 mm (6–9 inches) is recommended to support cables and maintain proper spacing during branching.

Support and Routing Considerations

- Support spacing should be adequate to prevent sagging, especially near branch points.
- Branching points should be planned to minimize sharp bends and avoid overcrowding.
