

Cable tray laying for instrumentation in Nauru

Article Overview

Instrumentation cable trays in Nauru should be installed using dedicated, properly sized, and separated trays to ensure signal integrity, safety, and compliance with international standards.

Key Considerations for Instrumentation Cable Tray Installation

Dedicated Trays: Instrumentation cables, which carry low-level signals, must be separated from power cables to prevent electromagnetic interference (EMI) and signal degradation. Use separate trays or compartments, or maintain sufficient physical separation with shielding if sharing trays is unavoidable . **Tray Types and Materials:** Choose trays based on environmental conditions. Common types include ladder trays for long runs, perforated trays for medium loads, solid-bottom trays for protection against dust and moisture, and wire mesh trays for flexible routing . **Materials** should suit local conditions: stainless steel for corrosive environments, galvanized steel for standard conditions, and fiberglass (FRP/GRP) for chemical or high-humidity areas . **Sizing and Fill Rules:** Ensure the total cable area does not exceed the maximum fill area (typically 40-50% of tray cross-section for multi-conductor cables) to allow proper heat dissipation and future expansion . Use the Area Fill Method for single-conductor cables and the Diameter Fill Method for multi-conductor cables to prevent overcrowding and maintain accessibility. **Installation Practices:**

- Support cables along their entire length to reduce mechanical stress and prevent...
