

Cable tray right-angle bend cabling

Article Overview

Right-angle bends in cable trays are achieved using pre-fabricated bend fittings or on-site fabrication, ensuring proper bend radius to maintain cable integrity and ease of installation.

Types of Right-Angle Bends

1. Horizontal Bends: Change the tray direction along the same elevation, typically 90° to navigate around walls, columns, or equipment. 2. Vertical Bends (Risers): Change the tray elevation, either upward or downward, to cross over obstacles like pipes or beams. 3. Compound Bends: Combine horizontal and vertical changes, requiring careful calculation of offset distances to maintain smooth cable flow ().

Construction Methods

Pre-Fabricated Fittings:

- Ladder, perforated, and wire mesh trays often come with 90° bend fittings.
- These fittings are designed to maintain the minimum bending radius required for the cables, preventing damage and easing cable pulling ().
- On-Site Fabrication:
 - Wire mesh trays can be bent live at the project using tools like a bolt cutter or bending jigs.
 - Protective measures, such as rubber caps or zinc-coated edges, prevent cable abrasion at cut or bent ends ().
 - Measure the straight section length along the tray to mark bending points accurately, ensuring the bend aligns with the intended path ()....
