

Cable tray single-sided connection

Article Overview

Single-sided cable tray systems use a central support rail with simplified connections, allowing cables to be laid on both sides and joined with single-bolt or clip connectors.

Overview of Single-Sided Cable Tray Systems

Single-sided or single rail cable trays are designed for lighter-duty cable support projects where traditional dual side rails are not required. These systems typically feature a center tubular rail that supports the tray, reducing the number of support points needed and simplifying installation . Cables can be laid on either side of the central rail, which eliminates the need to pull cables through multiple supports.

Connection Methods

- **Single Bolt Connections:** Sections of the tray are joined using a single bolt splice connector, which allows for quick and secure assembly .
- **EZ-Clip or Two-Bolt Splice Connectors:** Some systems, like the Husky Centray®, offer EZ-Clip connectors or two-bolt splice options for faster installation and alignment of tray sections .
- **Pre-Attached Rungs:** Rungs are often pre-attached transversely through the top or bottom of the central rail, providing structural support and reducing assembly time .

Support and Installation

- **Center Hanger Rods:** A single hanger rod is used at each support point, which reduces the number of supports and simplifies the layout
