

Cable tray trough

Article Overview

Cable trays and cable troughs are both systems for supporting and organizing cables, but trays are primarily overhead or wall-mounted support structures, while troughs are floor-laid channels providing secure, often covered routing.

Cable Trays

Cable trays are engineered support structures designed to route, support, and protect insulated electrical cables used for power distribution, control, instrumentation, and communication . They allow cables to be laid in bundles, improving accessibility, heat dissipation, and scalability. Common types include:

- Ladder Cable Tray: Features two side rails connected by rungs, ideal for heavy or high-voltage cables .
- Wire Mesh or Basket Tray: Made of wire mesh, providing flexibility and ventilation for lighter cables .
- Perforated or Ventilated Trough Tray: Solid bottom with ventilation holes, suitable for mixed cable systems .
- Solid Bottom Tray: Fully enclosed bottom for maximum protection, sometimes with covers for added security . Materials vary from stainless steel, electrogalvanized steel, hot-dip galvanized steel, to PVC, offering corrosion resistance, fire resistance, and durability . Cable trays are typically mounted on walls, ceilings, or under raised floors and allow easy cable access for maintenance or expansion.
