

Cable tray vertical upper right bend

Article Overview

A vertical bend at the upper right of a cable tray is typically a vertical inside bend, used to transition the tray upward along a wall or structure while maintaining cable integrity.

Understanding Vertical Bends

Vertical bends in cable trays allow the system to change elevation while keeping cables supported and protected. There are two main types:

- **Vertical Inside Bend:** Guides the tray upward from a lower to a higher level, ideal for moving cables from floor-mounted trays to ceiling-mounted systems or along walls . The bend can be made at angles typically between 30° and 90°, depending on the required elevation change . It is available for ladder, perforated, or wire mesh trays and can be customized to the tray width and length .
- **Vertical Outside Bend:** Directs the tray downward from a higher to a lower level, used when descending between floors or from overhead trays to equipment .

Installation Considerations

- **Bend Radius:** Ensure a smooth, gradual bend to minimize stress on cables and prevent damage .
- **Support:** Proper support at the bend point is crucial to maintain tray strength and prevent sagging .
- **Customization:** Vertical bends can be manufactured in any degree and size to match the cable tray system, including ladder, perforated, or wire mesh types
