To increase the number of available Ethernet ports: If you have multiple devices that require a wired Ethernet connection but you don't have enough available Ethernet ports on your router or modem, you can use a splitter or a network switch to split the Ethernet cable and provide. The splitter doesn't create extra ports. Gigabit Ethernet (1000 Mbps) uses all four wire pairs, so there are no spares to borrow. If you insert a passive splitter into a Gigabit setup, the link will usually drop down to 100 Mbps or fail altogether. A splitter is a small device that may divide an Ethernet wire into two separate connections. They are particularly useful in environments where running multiple cables is impractical.
