

Can an optical module be used within a 25km radius

Overview

Q1: Can I use a long-range SFP module with multimode fiber?

A: Generally, no. Q2: What is the difference between ZX and EX SFP modules?

SFP (Small Form-factor Pluggable) modules are standardized network transceivers that support a range of data rates (1G, 10G, 25G) and fiber types. Long-distance variants, typically referred to as LX, EX, ZX, or ER/LR SFPs, are engineered with higher optical power budgets and longer wavelength. Checking out the working wavelength and optical fiber mode of an optical module is one of the common ways to estimate how long an optical transceiver can reach. If the optical module works at a wavelength near 850nm (880nm) or 910nm (940nm), then the module is a multi-mode fiber (MMF) optical. It provides a whopping 25km of reach over duplex SMF (single-mode fiber). While the LR1-20 specification standardized by the 100G Lambda MSA supports 20km reach, Cisco's product will actually support 25km. They're essential for extending network distances and increasing bandwidth capabilities. Distance: Capable of supporting up to 300 meters over multimode fiber, SR is ideal for short, high-density data transfers. Wavelength: The color of light used (e.
