

Check the load of the distribution box

Article Overview

To check the load in a distribution box, measure the current on each circuit, sum the total wattage, and ensure it does not exceed the panel's rated capacity.

Step 1: Safety First

Before inspecting the distribution box, turn off the main breaker if possible and wear insulated gloves. Ensure the area is dry and free from conductive materials to prevent electrical shock. Only qualified personnel should perform high-current measurements .

Step 2: Identify the Main Breaker and Circuits

Locate the main breaker, which controls the total power entering the panel. Check its ampere rating (usually 100–200A for residential panels) and ensure it matches the incoming wire size . List all individual circuit breakers and note what each powers, including appliances and lighting .

Step 3: Measure Individual Circuit Loads

Use a digital multimeter (DMM) or a clamp meter to measure the current on each circuit. For AC circuits, measure the current in amperes and the voltage at the breaker terminals. Multiply voltage by current to calculate the wattage for each circuit . Ensure that no single circuit exceeds its breaker rating.

Step 4: Calculate Total Load...
