

Cold joints always fail

Overview

The main consequence of a cold joint is the loss of monolithic strength, which compromises the structural integrity of the element. A cold joint in concrete construction is a plane of weakness that forms when new, wet concrete is poured against concrete that has already begun to harden. This discontinuity occurs because the older material has passed its initial setting time, preventing a true chemical bond with the fresh mix. The delayed placement prevents full integration and knitting between the concrete batches and might lead to reduced structural robustness, increased. Few defects pose a more immediate and insidious threat to the long-term performance and intended load-transfer characteristics of a structure than cold joints in concrete columns. In this comprehensive guide, we will.
