

Connect copper wire to the distribution box

Article Overview

Copper wires should be securely connected to the distribution box terminals, with proper stripping, tightening, and grounding to ensure safe and reliable electrical distribution.

Preparing the Distribution Box

Before connecting any wires, ensure the power supply is completely turned off and verify with a tester that no electricity is present. Inspect the distribution box for damage, and confirm that all components such as circuit breakers, busbars, and terminal blocks are intact and rated for the intended load . Mount the box securely on a stable surface, keeping it level and accessible, preferably in a dry, ventilated area .

Connecting Phase, Neutral, and Ground Wires

- **Strip the Wire Ends:** Use a wire stripper to remove insulation from the copper wire ends, exposing enough length to make a firm connection to the terminal .
- **Phase and Neutral Connections:** Connect the phase (live) wire to the designated phase terminal and the neutral wire to the neutral terminal. Ensure the wires are fully inserted and the screws are tightened to prevent loose connections .
- **Grounding Connection:** Use a yellow-green insulated copper wire for grounding. Connect it to the PE (Protective Earth) bar or grounding terminal inside the box. Strip the wire, insert it into the terminal, and tighten the screw securely. If electrical components inside the box require grounding, connect them to the PE bar as well
