

Connecting a single-pole distribution box to power

Article Overview

To connect a single-pole distribution box to power, the main supply is routed through a main MCB, then through an RCCB, with single-pole MCBs distributing phase to individual loads, while neutral and earth are connected to their respective busbars.

Step-by-Step Connection

1. Identify Components: A typical single-phase distribution box includes a Main Double-Pole MCB, Single-Pole MCBs for individual loads, an RCCB for residual current protection, a neutral busbar, and an earth busbar . 2. Connect the Main Supply:

- Connect the phase (live) and neutral wires from the incoming power supply to the input terminals of the main MCB.
- The main MCB acts as the primary isolator and protects the entire distribution box .

3. Connect the RCCB:

- Connect the output of the main MCB to the input of the RCCB.
- The RCCB provides protection against earth leakage and ensures safety for all downstream circuits .

4. Wiring Single-Pole MCBs:

- Connect the phase wire from the output of the RCCB to the input of each single-pole MCB.
- The neutral wire from the RCCB output is connected to the neutral busbar, which distributes neutral to all loads .
- Each single-pole MCB output then connects to the phase terminal of the respective load.

5. Earth Connections:...
