

Construction of electrical distribution box in shopping mall

Article Overview

A shopping mall's electrical distribution box must be carefully designed and installed to handle diverse loads safely, ensure reliability, and comply with local electrical codes.

Site Selection and Placement

The distribution box should be installed close to the main power supply to minimize power loss and facilitate maintenance, typically in electrical rooms, basements, or corridors that are dry, well-ventilated, and free from corrosive or flammable substances . The installation height is generally 1.5–1.8 meters above the floor for easy access and inspection . Ensure the location allows safe and convenient access for electricians and maintenance personnel .

Box Selection and Design

Choose a box with adequate load capacity and IP/NEMA rating suitable for indoor mall environments . Malls require multiple distribution boxes to handle low-power circuits (32A) for store lighting and small equipment, medium-power circuits (125A) for ventilation and air conditioning), and high-power circuits (up to 800A) for escalators, elevators, and emergency systems . Use modular designs to allow future upgrades and zoned control for rapid fault isolation .
