

Converting a network cabinet into a control cabinet

Article Overview

A network cabinet can be converted into a control cabinet by reinforcing its structure, adding industrial-grade components, ensuring proper cooling, and complying with electrical and safety standards.

Understanding the Differences

A network cabinet is designed to house IT equipment such as servers, switches, and patch panels, focusing on organization, airflow, and security for network devices . In contrast, a control cabinet is intended for industrial automation, housing electrical components, PLCs, relays, actuators, and power distribution systems, while protecting them from dust, moisture, vibrations, and temperature extremes . Control cabinets also ensure proper voltage distribution and system reliability.

Key Steps for Conversion

- Structural Assessment and Reinforcement
- Ensure the cabinet can support heavier industrial components like circuit breakers, busbars, and inverters.
- Reinforce mounting panels and shelves to handle additional weight and vibration.
- Component Selection and Layout
- Install industrial-grade DIN rails, terminal blocks, PLCs, relays, and actuators .
- Plan the layout to allow easy access for maintenance and future expansion.
- Consider modular solutions like EtherNet/IP in-cabinet systems to reduce wiring c...
