

Correct wiring for a three-level distribution box

Article Overview

A three-phase distribution box is wired by connecting the incoming three-phase supply to the main MCCB, distributing power to MCBs via busbars, and ensuring proper neutral and earth connections for safe and balanced power distribution.

Key Components

- MCCB (Molded Case Circuit Breaker): Acts as the main switch and provides protection against overloads and short circuits .
- MCBs (Miniature Circuit Breakers): Protect individual circuits; three-pole MCBs are used for three-phase loads .
- RCCB/RCD (Residual Current Device): Optional, for enhanced protection against earth faults .
- Busbars: Connect the main MCCB to outgoing MCBs, ensuring high-current capacity and balanced distribution .
- Neutral and Earth Links: Distribute neutral and earth connections to all circuits .

Step-by-Step Wiring Procedure

- Phase Identification: Label the three incoming phases as L1, L2, and L3, along with Neutral (N) and Earth (E) to avoid confusion during installation .
- Connect Incoming Supply: Attach the three-phase supply to the input terminals of the main MCCB. If using a four-pole MCCB, connect the neutral to the neutral terminal; otherwise, connect it to the neutral busbar .
- Busbar Connections: Connect the output terminals of the MCCB to the busbars, w...
