

Cross section of large optical cable

Article Overview

A large optical cable cross-section typically consists of multiple fibers arranged in protective tubes, surrounded by strength members and an outer jacket for environmental protection.

Core Components

Optical Fibers: The central element of the cable, usually coated with a primary buffer of 250 microns. Fibers can be singlemode or multimode depending on the application . **Buffer Tubes:** In loose tube designs, several fibers are grouped inside small plastic tubes, which may be filled with water-blocking gel or powder to prevent moisture damage . **Tight buffer designs** encase each fiber individually for easier handling and direct termination. **Central Strength Member:** Often a rigid rod made of steel or fiberglass, providing structural support and preventing fiber strain during installation . **Aramid Yarn or Kevlar:** Surrounds the buffer tubes to add tensile strength, allowing the cable to withstand pulling forces during installation, especially in aerial or conduit applications . **Outer Jacket:** The protective layer made of polyethylene, PVC, or flame-retardant materials, shielding the fibers from environmental hazards such as moisture, chemicals, temperature extremes, and rodent damage . **Optional Armor:** Some large outdoor cables include metallic armor or additional jackets for mechanical protection and rodent resistance, particularly in direct-buried or submarine applications .

Variations in Large Cables

- **Loose Tube Cables:** Ideal for high fiber counts and outdoor trunking; fibers are pro...
