

Data Center PDU Load Calculation

Overview

Use this TradeOff Tool to estimate the power required by a data center with traditional, or AI/HPC servers. Configure different server, storage, and design attributes to explore different scenarios. Without proper power distribution units, even the most advanced data center can face unexpected downtime, overloaded circuits, or inefficient energy use. White paper 3 presents methods for calculating power and cooling requirements and provides. This guide provides the complete power planning methodology for modern data centers — from needs assessment and redundancy selection through the validated five-category load calculation framework to generator sizing and the emerging HVDC architectures that are beginning to replace traditional AC. We have both AP8861 20A (for servers) and AP8941 30A (for network equipment) PDU's and I am trying to calculate how much load the equipment in each rack will use, I can then plan where everything can go. We will have 2 PDUs per rack and use 3 phase power. Operating IT Load (kW): $\text{base IT load} \times \text{utilization} \div 100$. kVA: $\text{kVA} = \text{kW} \div \text{power factor}$.
