

Differences between optical distribution boxes and optical delivery boxes

Article Overview

Optical distribution boxes distribute fiber from feeder cables to multiple subscribers, while optical delivery (termination) boxes provide the final connection point to end-user equipment.

Optical Distribution Boxes (ODB)

Function: Optical distribution boxes act as intermediate nodes in fiber networks, distributing optical signals from feeder cables to multiple drop cables for subscribers . They often integrate fiber splicing, termination, and PLC splitter installation for FTTH or FTTB networks . **Deployment Environment:** These boxes are typically installed in corridors, small community telecom rooms, outdoor poles, or wall-mounted locations . They are designed for multi-user access, serving several homes or offices from a single feeder line. **Port Capacity:** Commonly available in 24, 48, or custom port configurations, with smaller versions (4-16 ports) for villas or small businesses . They are larger than termination boxes but smaller than ODFs. **Key Features:**

- Distributes optical signals to multiple subscribers
- Supports optical splitter management
- Provides space for fiber slack and splicing
- Designed for easy maintenance and future expansion
