

Does the H200 have an optical module

Article Overview

The NVIDIA H200 GPU itself does not include a built-in optical module, but H200-based systems, such as DGX H200 clusters, use external 800G optical transceivers for high-speed interconnects.

H200 GPU Connectivity

The H200 GPU is designed for high-performance computing and AI workloads, featuring HBM3e memory and the Hopper architecture, but it does not have integrated optical modules or display outputs. It connects to the system via PCIe or SXM interfaces, and its primary role is GPU computation rather than direct optical signal conversion .

Optical Modules in H200 Clusters

In DGX H200 or HGX H200 deployments, optical modules are used externally to enable high-speed InfiniBand interconnects between GPUs and servers. These clusters rely on 800G optical transceivers, such as multimode SR8 or single-mode DR8 modules, to handle the massive data transfer required for AI and HPC workloads . The choice of module depends on factors like:

- Link type: Server-to-Leaf or Leaf-to-Spine connections
- Distance: Short links may use DAC cables, while longer links require optical transceivers
- Form factor: ConnectX-7 NICs in H200 servers require RHS (Flat-top) modules, while Quantum-2 switches use IHS (Finned-top) modules These optical modules convert e...
