

Eg Fiber Optic Communication

Overview

Fiber-optic communications involve the transmission of light signals through flexible fibers made from glass or plastic, enabling high-speed data transfer for various applications such as telecommunications, internet services, and medical imaging. Fiber optic connectors offer numerous advantages over traditional copper connectors. There are different types of fiber optic interconnect. In 1880, Alexander Graham Bell conducted an experiment where he made a phone call using natural light (sunlight) to convert his voice into light via a “photophone.” This light was transmitted approximately 700 ft. An Optical Fiber is a cylindrical fiber of glass that is hair-thin in size or any transparent dielectric medium. Total internal reflection prevents light inserted into one end of the fibre from escaping through the sides.
