

Equipment-type SD-WAN leased line

Overview

Internet leased lines (ILLs) are point-to-point internet connections that give businesses a private connection with an internet service provider (ISP). Hence, they operate in the manner of an underlay for businesses to operate in a high-speed and reliable connection environment. But there are inherent issues with the underlay functionalities of ILL. The ICT revolution has prompted enterprises to embrace cloud-first approaches and virtualized operations. Traditionally, businesses relied on internet leased lines to establish exclusive connectivity between offices and headquarters, ensuring reliable and consistent internet availability while avoiding the bandwidth limitations commonly associated with a leased line. A leased line is an internet connection that is provided exclusively to a business as a private connection that supports high-speed, low-latency services. Hence, organizations are able to leverage leased lines for mission-critical applications like video conferencing, VoIP, and file transfer that demand bandwidth and secure features. Hence, in today's world, SD-WAN is a software-based networking solution that allows businesses to manage and optimize their WAN connections. It uses software to control the routing of network traffic, making it possible to adjust traffic paths based on real-time network conditions dynamically. This allows businesses to prioritize different types of traffic and ensure that critical traffic is given priority. The global shift to cloud-run services has placed unprecedented demand for reliable and secure internet connectivity. Traditional internet leased lines have been efficient solutions for on-premise businesses thus far. But new work processes like remote work and multiple-loci business structures need more than what simple internet leased lines can offer.
