

FC pigtail test

Overview

Quality Assurance: Every FC pigtail undergoes strict quality testing including insertion loss verification, return loss measurement, and endface inspection to meet industry standards (IEC 61753-1, Telcordia GR-326). Fiber pigtails are simple in appearance, yet essential in function. By combining factory-installed connectors with spliced bare fiber, pigtails ensure that network installers can create. A fiber optic pigtail is a short, usually unjacketed, optical fiber cable that has a factory-installed connector on one end and a length of exposed fiber at the other. The connector end can be linked directly to network equipment, while the exposed end can be spliced to another fiber optic cable. Featuring the robust threaded FC (Ferrule Connector) design, our pigtails deliver secure connections, excellent. This article is a selection guide for Fiber patch cords and pigtails, which systematically introduces the definitions and differences between the two, different application environments and construction types, specifications and parameters of single core and multi-core Fiber Optic connectors. A fiber pigtail is typically a fiber optic cable with one end factory pre-terminated fiber connector and the other exposed fiber. It is usually suitable for field termination using a mechanical or fusion splicer. Compared with quick termination or epoxy and polish connections placed on the field. Executive Summary: A fiber optic pigtail is one of the most commonly specified yet least understood components in structured cabling.
