

Fiber Optic Fixing Method for Distribution Box

Article Overview

Fiber optic cables in a distribution box are fixed using cable entry grommets, splice trays, bend radius clips, and cable ties to ensure secure, organized, and protected connections.

Key Components for Fixing Fibers

Fiber optic distribution boxes typically include a shell, internal supporting frame, splice trays, fixing devices, and fiber joint protective elements . These components allow for proper cable entry, secure fixation, and organized routing of fibers. Bend radius control clips or spools are used to prevent excessive bending, which could damage the fibers .

Steps for Fixing Fiber Optic Cables

- **Mounting the Distribution Box:** Secure the box to a wall, rack, or DIN rail using brackets and screws, ensuring it is level and accessible . Wall-mounted boxes are common for FTTH installations, while rack-mounted boxes are used in data centers .
- **Preparing Cable Entry:** Use grommets or rubber diaphragms at the cable entry points to protect fibers from sharp edges and to hold the cable firmly in place . Ensure the cable jacket is stripped and cleaned before entering the box.
- **Securing the Cable:** Fix the incoming and outgoing cables using cable ties or movable clamps at designated points inside the box. This prevents tension on the fibers when the front panel is pulled out or during maintenance .
- **Splicing and Termination:** Route fibers through plastic guide posts or spools to the...
