

Fiber Optic Rotating Terminal Box

Article Overview

A Fiber Optic Rotating Terminal Box is a specialized enclosure designed to terminate, splice, and manage fiber optic cables while allowing rotational access for easier installation and maintenance.

Overview

A fiber optic terminal box serves as the interface between incoming feeder cables and outgoing drop cables in FTTH (Fiber-to-the-Home) or FTTX networks. It provides a secure, organized environment for splicing fibers, connecting pigtailed, and housing connectors, ensuring minimal optical loss and protection from environmental factors. A rotating design allows the internal trays or cassettes to pivot, giving technicians easier access to fibers without disturbing other connections, which is particularly useful in high-density or compact installations.

Key Features

- **Rotational Access:** Internal trays or cassettes rotate to provide full access to splices and connectors, reducing installation time and risk of fiber damage.
- **Capacity:** Available in various sizes, from small 2-8 port boxes to high-density units terminating 72-168 fibers.
- **Modularity:** Supports multiple configurations including splice-only, patch-only, or combined splice and patch setups. Some models accommodate splitters for FTTH networks.
- **Environmental Protection:** Designed for indoor or outdoor use with IP65-IP68 ratings, UV-stable materials, gasketed doors, and dust-proof enclosures.
