

Fiber Optic Splitter Box Patch Cord

Article Overview

A fiber optic splitter patch cord divides light from a single optical fiber into multiple branches, enabling signal distribution across several fibers while maintaining uniform intensity.

Overview

A fiber optic splitter patch cord is designed to split the optical signal from a large core fiber into two or more smaller core fibers. This allows a single light source, such as a laser or LED, to be shared among multiple fibers while maintaining consistent light intensity across outputs . The splitter typically includes a short section of large core fiber (around 15 cm) to ensure uniform light distribution before branching into multiple fibers .

Key Features

- **Branching Options:** Standard cords often have 2 branches, but more branches can be customized based on requirements .
- **Power Distribution:** A 2-branch splitter usually outputs about 16% of the input power per branch, with variations depending on fiber type and area recovery ratio .
- **Connector Types:** Available with SC, LC, FC, ST, and other connectors for single-mode or multimode fibers .
- **Low Insertion Loss:** High-precision ferrules and factory testing ensure minimal signal loss and stable performance .
- **Durability:** Some patch cords are ruggedized for outdoor use, UV-stabilized, and waterproof for long-term deployment
