

Fiber optic cable laying completed

Article Overview

Fiber optic cable laying is complete once the cables are installed, tested, connected to the optical network terminal, and the network is fully operational.

Installation Completion Steps

Once the fiber optic cable has been laid, either by blowing or pulling through ducts, the next steps ensure the network is functional and reliable :

-

Termination and Splicing: Individual fiber strands are carefully connected or spliced to ensure a continuous optical path. This step is critical for signal integrity and long-term performance .

-

Testing and Certification: Each fiber is tested for insertion loss, return loss, and OTDR (Optical Time-Domain Reflectometer) performance. Only after passing these tests is the network considered ready for use .

-

Connection to Optical Network Terminal (ONT): The fiber is connected to the ONT, which converts optical signals into data usable by devices. The ONT is then linked to the network box via an Ethernet cable .

-

Network Activation and Device Setup: After powering the network box, devices such as computers, routers, and printers are connected. Wi-Fi configuration, firmware up...
