

Fiber optic connection to switch router

Article Overview

Fiber optic connections require an Optical Network Terminal (ONT) to convert light signals into electrical signals, which are then connected to a router or switch via Ethernet.

Key Components

- **Optical Network Terminal (ONT):** This device is provided by your ISP and converts the incoming fiber optic light signals into standard electrical signals that networking equipment can use .
- **Fiber-Ready Router or Switch:** Ensure your router or switch supports high-speed connections. Some enterprise switches have SFP (Small Form-factor Pluggable) ports for direct fiber connections, while most home routers use Ethernet from the ONT .
- **Fiber Optic Cable:** Typically a thin, yellow cable with SC/APC or SC/UPC connectors, connecting the ISP's fiber line to the ONT .
- **Ethernet Cable:** Used to link the ONT to your router or switch, usually Cat6 or higher for optimal speeds .

Step-by-Step Connection

- **Install the ONT:** Connect the fiber optic cable from the wall outlet to the ONT's optical port. Power on the ONT and wait for the status lights to stabilize .
- **Connect to Router or Switch:** Use an Ethernet cable to connect the ONT's LAN or Ethernet output port to the WAN port on your router or an uplink port on your switch .
- **Power On Networking Devices:** Turn on the router or switch after the ONT is active. Verify connectivity through status lights or by testing internet access .
- **Configure Network Settings:** Access your router's interface to configure IP settings, Wi-Fi, and security. For switches, ensure VLANs or port settings match your network...
