

Fiber optic interface without router

Article Overview

You can set up a fiber optic network without a traditional router by using an optical network unit (ONU) and direct device connections or media converters.

Using an Optical Network Unit (ONU)

Fiber internet does not require a traditional modem. Instead, an ONU serves as the gateway between the fiber line and your devices. The ONU converts light signals from the fiber optic cable into digital Ethernet data that your devices can use directly, enabling high-speed internet access without a router . It also authenticates the connection with your internet service provider and supports speeds often exceeding 1 Gbps .

Direct Device Connections

For a simple setup, you can connect devices directly to the ONU using Ethernet cables. This works well for a small number of devices, such as a desktop computer, gaming console, or smart TV. Each device will need a manually assigned IP address if the ONU does not provide DHCP functionality . This method is ideal for point-to-point connections where Wi-Fi is not required.

Using Media Converters and Fiber Kits

If you want to extend fiber connectivity to multiple devices without a router, you can use fiber-to-Ethernet media converters. Kits like the InvisiLight Home Fiber Kit include ultra-thin fiber cables and converters that allow you to run fiber directly to each dev...
