

Fiber to the Home Router DHCP

Article Overview

DHCP on a Fiber Home router allows automatic IP address assignment to devices, and proper configuration ensures smooth network operation.

Enabling and Configuring DHCP

To enable DHCP on a Fiber Home router, access the router's admin panel through a web browser, usually by entering the router's IP address (commonly 192.168.1.1). Navigate to the DHCP section, where you can enable DHCP and define the IP address range that the router will assign to connected devices, for example, 192.168.1.2 to 192.168.1.80. You can also configure the lease time, which determines how long a device keeps its assigned IP before requesting a renewal. Save the settings to activate DHCP on the network .

Using Third-Party Routers with Fiber

If you want to use your own router with a fiber connection, the fiber gateway (ONT or ISP-provided device) typically handles the fiber signal conversion. You can connect your router to the gateway via Ethernet and configure the router's WAN interface to use DHCP to obtain an IP automatically. This setup allows your router to manage your local network while the gateway handles the fiber connection . Ensure firmware is updated and Wi-Fi security is configured for optimal performance .

Avoiding DHCP Conflicts

When using multiple routers, conflicts can occur if more than one device is assignin...
