

Fiberglass Supported Cable Trays

Article Overview

Yes, fiberglass (FRP) is commonly used to make cable trays due to its strength, corrosion resistance, and lightweight properties.

Fiberglass cable trays, also known as FRP (Fiberglass Reinforced Plastic) cable trays, are structural support systems designed to route and protect electrical and instrumentation cables. They are manufactured by combining glass fibers with resin materials such as polyester, vinyl ester, or epoxy, resulting in a composite that is strong, durable, and resistant to harsh environmental conditions.

Key Advantages of Fiberglass Cable Trays

- **Corrosion Resistance:** FRP trays resist moisture, chemicals, and UV exposure, making them ideal for chemical plants, offshore platforms, water treatment facilities, and other corrosive environments.
- **Lightweight and Strong:** Fiberglass trays weigh significantly less than steel (about 1/3 to 1/4 the weight) while maintaining comparable or superior strength, which simplifies installation and reduces transportation costs.
- **Electrical Insulation:** FRP is non-conductive, reducing the risk of electrical hazards and making it suitable for high-voltage or sensitive installations.
- **Durability and Low Maintenance:** These trays have long service lives, withstand extreme temperatures, and require minimal maintenance compared to metal trays.
- **Flexibility in Design:** Fiberglass trays are available in ladder, trough, and channel types, with modular components like straight sections, elbows, tees, and covers, allowing customization for complex cable routing
