

Fiberglass cable trays made of flame-retardant material

Article Overview

Yes, fiberglass (FRP/GRP) cable trays are flame retardant and designed to resist fire while minimizing toxic emissions.

Fiberglass cable trays are made from flame-retardant composite materials, typically combining fiberglass with thermosetting resins, which provide excellent fire resistance . These trays do not ignite easily and, when exposed to high heat, thermosetting resins form a protective carbonized layer that prevents flames from spreading . Unlike some materials, they are halogen-free and do not release toxic gases during a fire, enhancing safety in critical installations .

Material and Fire Performance

- Thermosetting resin FRP trays: Highly fire-resistant, ideal for industrial facilities, power plants, data centers, and hospitals .
- Thermoplastic resin FRP trays: Offer limited heat resistance and may melt or drip under fire, making them unsuitable for high-risk areas .
- Certifications: Many FRP/GRP trays meet international standards such as IEC 61537, NEMA FG-1 (UL568), and UL 94 V0, ensuring verified flame-retardant performance .

Advantages in Fire Safety

- **Non-combustible and corrosion-resistant:** Fiberglass trays do not rust or corrode, maintaining structural integrity during fire exposure ...
