

Forward PoE Switch

Article Overview

A Forward PoE Switch is a PoE-enabled network switch that can pass unused power from one powered device to another, enabling daisy-chaining of multiple devices over a single Ethernet run.

What is a Forward PoE Switch?

A Forward PoE Switch is a type of Power over Ethernet (PoE) switch that not only supplies power and data to connected devices but also supports PoE Power Forwarding. This feature allows a powered device (PD), such as a wireless access point or IP camera, to forward any unused power to another PD downstream, effectively creating a daisy-chain of PoE devices . This is particularly useful in environments with limited Ethernet ports or where running multiple cables is impractical.

How PoE Power Forwarding Works

- **Single Ethernet Run:** Each Ethernet link can extend up to 100 meters. By forwarding power, multiple devices can share a single Ethernet connection .
- **Power Allocation:** For example, if a PoE port provides 90W and the first device consumes 40W, the remaining 50W can be forwarded to a second device. This ensures efficient use of the available PoE budget .
- **Standards Compatibility:** Forward PoE switches typically support IEEE 802.3af (PoE), 802.3at (PoE+), and 802.3bt (PoE++) standards, allowing them to deliver up to 100W per port depending on the device requirements
