

GPON optical modules are divided into ONU and OLT

Overview

The main components of a GPON system include the Optical Line Termination (OLT), Optical Network Unit (ONU), and Passive Optical Splitter. The OLT is responsible for transmitting data downstream, while the ONU transmits data upstream. A network PON (Passive Optical Network) is a fiber optic distribution infrastructure that uses no active equipment between the operator's central office and the subscriber's premises. Transmission relies solely on passive optical splitters — components without power supply that divide the signal. To date, most FTTH deployments in planning and deployment have used PON to save on fiber costs. PON has attracted much attention in recent years due to its low cost and high performance. PON. GPON (Gigabit Passive Optical Networks) is one of the standards for PON-based broadband access, designed to deliver high-speed internet, efficient service, wide-ranging signal coverage, and a variety of access ports.

What are OLT, ONU, ONT and ODN in PON?

A GPON system usually consists of an OLT (Optical Line Terminal) at the service provider's central office and multiple ONU (Optical Network Units) or ONT (Optical Network ...

What is GPON ONU(ONT) and GPON OLT?

Part 1. What Is Gpon Onu (Ont)?Part 2. What Is Gpon Olt?Part 3. How Gpon Onu (ONT) and Gpon Olt Work TogetherThe Bottom LineThe GPON ONU (ONT) and GPON OLT are two primary components that make a GPON network function. The OLT acts as the central point of management and data distribution, while the ONT handles the end-user side, converting the optical signals into usable data for local devices. In this symbiotic relationship, the OLT serves as the upstream gateway for da...See more on vsolcn Cisco

Understand GPON Technology - Cisco

GPON replaces the traditional three-tier Ethernet design with a two-tier optic network which eliminates access and distribution Ethernet switches with passive optical devices.
