

Galvanized flat iron for cable trays

Article Overview

Galvanized flat iron connections are used to join cable tray sections securely, providing structural support and corrosion resistance in both indoor and outdoor installations.

Material and Standards

Galvanized flat iron used for cable tray connections is typically made from structural steel that is either pre-galvanized (mill galvanized) or hot-dip galvanized after fabrication. Pre-galvanized steel meets ASTM A653 SS, Grade 33, coating designation G90, while hot-dip galvanized steel follows ASTM A123 for zinc coatings, ensuring long-term corrosion protection . Covers and splice plates for these connections must also be hot-dip galvanized after fabrication to prevent damage to cables and maintain safety .

Types of Connections

Flat iron connections are commonly used as splice plates or joining brackets to connect two cable tray sections in a straight line or at angles. They can be:

- Straight connectors: Join two trays in a linear configuration.
- Clamp connectors: Secure trays after bending or for adjustable alignment.
- Splice plates: Flat iron plates bolted across tray ends to maintain structural integrity . These connectors are designed to handle the mechanical load of the cable trays and maintain alignment, especially in ladder, perforated, or solid-bottom trays
