

How to add a router to a mobile fiber optic connection

Article Overview

A router can only be connected directly to a fiber optic line if it has a compatible SFP or fiber input port; otherwise, an ONT is required to convert the fiber signal to Ethernet.

Standard Setup for Fiber Internet

Most fiber connections, including mobile fiber services, require an Optical Network Terminal (ONT). The ONT converts the light-based fiber signal into an Ethernet signal that your router can use. Typically, the ONT is provided by your ISP and connects to your router via a standard Ethernet cable. This setup ensures compatibility and allows your router to handle high-speed data without specialized fiber hardware.

Direct Connection Considerations

Some advanced routers have SFP ports designed for fiber input. In these cases, you can connect the fiber cable directly to the router using a compatible SFP module. However, there are several caveats:

- The SFP module must match the ISP's fiber type and specifications.
- Some ISPs require their own SFP modules or registration of the device on their network.
- Direct fiber connection may not provide practical speed advantages for typical home plans under 1 Gbps, as Ethernet from the ONT is usually sufficient
