

How to clean the lens of a fiber optic sensor

Article Overview

Use lint-free wipes, high-purity isopropyl alcohol, and specialized fiber optic cleaning tools to safely remove dust, oils, and residues from the lens.

Key Principles

Fiber optic lenses are extremely sensitive to contamination. Even microscopic dust, dirt, or oils can reduce signal strength, increase attenuation, or cause total transmission failure, so careful cleaning is essential for maintaining performance and preventing costly downtime .

Recommended Tools and Materials

- Lint-Free Cleaning Wipes: Non-abrasive wipes prevent fibers or particles from scratching the lens .
- High-Purity Isopropyl Alcohol: Used with lint-free wipes to remove oils and residues; ensure it is free of water and contaminants .
- Fiber Cleaning Pens or Sticks: Designed to clean the end-face of fiber connectors with a spinning cloth for precise cleaning .
- Compressed Air or Air Dusters: Safely blow away dust without touching the lens surface .
- Cleaning Swabs: For ferrule surfaces inside adapters or ports .
- Inspection Microscope: Essential for checking cleanliness before and after cleaning to ensure no contaminants remain
