

How to ground a double-door complete electrical distribution box

Article Overview

Proper grounding of a double-door distribution box involves connecting the enclosure, internal components, and doors to a dedicated grounding system using appropriately sized copper conductors to ensure safety and compliance.

Step 1: Identify Grounding Points

Open the distribution box and locate the grounding bar (PE bar) or the position marked for grounding. This is typically attached to the backpanel of the enclosure and serves as the central point for all grounding connections. Ensure that the metal backpanel is securely mounted to the enclosure using machine screws or nuts with star washers to maintain good electrical contact.

Step 2: Connect the Main Ground Wire

Attach the main power ground wire from the incoming power supply directly to the PE bar. Use a yellow-green insulated copper wire with a cross-sectional area meeting local standards (e.g., 10 AWG in the US or 6 mm² elsewhere). Strip the wire appropriately, insert it into the terminal, and tighten the screw to ensure a firm connection. The ground path resistance should be very low, ideally less than 0.1 ohm between the enclosure and the source ground.

Step 3: Ground Internal Components...
