

How to secure the steel wire in the optical fiber cable

Overview

Once routed, secure the cable gently without crushing it. Avoid tight bundles—armored cables need more space for heat dissipation and movement. “Securing” fiber optic cable goes beyond just preventing it from moving; it encompasses protecting its delicate core from physical stress, environmental degradation, and ensuring long-term signal integrity. Each accessory serves a specific purpose: fiber tension clamps provide the right tension without damaging cables, drop wire clamps secure cables in outdoor environments, and anchor. Armored fiber cables are designed with an additional protective structure—typically stainless steel, corrugated steel tape, or Kevlar reinforcement—to resist crushing, bending, moisture, rodents, and mechanical stress. Their installation shares similarities with regular fiber optic cords but also. A steel messenger is a stranded steel cable that acts lashing wire. This document describes further details of messenger strand, lashing wire, and the planning and installation process. With a combination of stainless steel wire and reinforced nylon body, Fibeye tension clamps offer excellent durability and performance.
