

How to use a mobile 1 2 beam splitter

Article Overview

A 1:2 beam splitter divides an input beam into two output beams with a 1:2 power ratio, and proper connection requires correct orientation, alignment, and secure mounting.

Understanding the 1:2 Beam Splitter

A 1:2 beam splitter is designed to split an incident light beam into two beams where one beam carries one-third of the total power and the other carries two-thirds. This can be achieved using non-polarizing plate or cube beam splitters, or fiber-optic splitters depending on your setup . Non-polarizing splitters maintain the same wavelength in both outputs, while polarizing splitters separate beams based on polarization .

Physical Connection and Mounting

- **Identify Input and Output Ports:** Most cube splitters have a designated input face and two output faces. Plate splitters are usually placed at a 45° angle of incidence to the incoming beam .
- **Secure the Splitter:** Use an optical mount or holder to stabilize the splitter. For mobile setups, ensure the mount allows adjustment in tip, tilt, and rotation to align the beam accurately.
- **Fiber or Free-Space Coupling:** If using fiber-optic splitters, connect the input fiber to the designated input port and the output fibers to the two output ports. For free-space setups, align mirrors or lenses to direct the split beams to their respective paths
