

Indoor low-level distribution box

Article Overview

An indoor low-level distribution box is a compact, wall-mounted or floor-standing enclosure designed to safely distribute low-voltage electricity to multiple circuits within a building.

Overview

Indoor low-level distribution boxes, also known as sub-main distribution boards (SMDBs) or multi-service distribution boards (MSDBs), are engineered to provide safe, organized, and efficient electrical distribution for residential, commercial, or light industrial applications. They are typically installed inside buildings to protect electrical circuits from overloads, short circuits, and accidental contact.

Key Features

- **Capacity and Circuit Management:** Designed to handle a range of currents, often up to 630 A, and accommodate multiple circuits with space for future expansion.
- **Safety:** Equipped with Miniature Circuit Breakers (MCBs) or fuses to prevent overloads and short circuits. Fully insulated operator levels enhance safety for users.
- **Materials:** Indoor boxes are usually made from mild steel, powder-coated steel, or plastic, which are lighter than outdoor-rated enclosures and suitable for indoor environments.
- **Standards Compliance:** Certified according to IEC/EN 61439 and IEC/EN 62208, ensuring reliable operation and adherence to international safety standards.
- **Installation Flexibility:** Can be wall-mounted or floor-standing, with modular interiors allowing for removable mounting inserts or fixed installations depending on project...
