

Installation Standards for Primary Distribution Boxes

Article Overview

Primary distribution boxes should be installed in dry, accessible, and well-ventilated locations, at a standard height of 1.5–1.8 meters, with proper grounding, protection devices, and compliant wiring.

Site Selection and Placement

The distribution box should be installed close to the main power supply to minimize power loss and ensure safety. Avoid humid, corrosive, or flammable environments, and ensure the location allows easy access for maintenance and inspection. For outdoor installations, select enclosures with appropriate IP or NEMA ratings (e.g., IP66 or NEMA 4) to protect against water, dust, and environmental hazards. Leave sufficient space around the box for ventilation and future upgrades .

Mounting and Height

The bottom edge of the box is typically installed between 1.5 and 1.8 meters above the ground, which is convenient for operation and inspection. Use firm and reliable mounting methods, such as brackets or screws, to prevent movement or tilting due to vibration or accidental impact .
